

79LV2040

20 Megabit (512K x 40-Bit) Low Voltage EEPROM MCM

Logic Diagram

FEATURES:

- 512k x 40-bit EEPROM MCM
- RAD-PAK® radiation-hardened against natural space radiation
- Total dose hardness:
 - >100 krad (Si)
 - Dependent upon orbit
- Excellent Single event effects
 - $SEL_{TH} > 84 \text{ MeV/mg/cm}^2$
 - $SEU \sim 26 \text{ MeV/mg/cm}^2$ read mode
 - $SEU \text{ Staurated Cross Section} \sim 2 \times 10^{-12} \text{ cm}^2/\text{Bit}$ (Read Mode)
 - $SEU = 11 \text{ MeV/mg/cm}^2$ write mode
 - $SEU \text{ Staurated Cross Section} \sim 6 \times 10^{-9} \text{ cm}^2/\text{Bit}$ (Write Mode)
- High endurance
 - 10,000 cycles (Page Programming Mode)
 - 10 year data retention
- Page Write Mode: 128 Dword Page
- High Speed:
 - 200 and 250 ns maximum access times
- Automatic programming
 - 15 ms automatic Page/Dword write
- Low power dissipation
 - 100 mW/MHz active current
 - 1.5 mW standby current

DESCRIPTION:

Maxwell Technologies' 79LV2040 multi-chip module (MCM) memory features a greater than 100 krad (Si) total dose tolerance, dependent upon orbit. Using Maxwell Technologies' patented radiation-hardened RAD-PAK® MCM packaging technology, the 79LV2040 is the first radiation-hardened 20 megabit MCM EEPROM for space application. The 79LV2040 uses twenty 1 Megabit high speed CMOS EEPROM die to yield a 20 megabit product. The 79LV2040 is capable of in-system electrical byte and page programmability. It has a 128 x 40 page programming function to make the erase and write operations faster. It also features Data Polling and a Ready/Busy signal to indicate the completion of erase and programming operations. In the 79LV2040, hardware data protection is provided with the \overline{RES} pin, in addition to noise protection on the \overline{WE} signal and write inhibit on power on and off. Software data protection is implemented using the JEDEC optional standard algorithm.

Maxwell Technologies' patented RAD-PAK® packaging technology incorporates radiation shielding in the microcircuit package. It eliminates the need for box shielding while providing the required radiation shielding for a lifetime in orbit or space mission. In a GEO orbit, RAD-PAK provides greater than 100 krad (Si) radiation dose tolerance. This product is available with screening up to Maxwell Technologies self-defined Class K

EEPROM APPLICATION NOTES

This application note describes the programming procedures for the EEPROM modules and with details of various techniques to preserve data integrity.

Automatic Page Write

Page-mode write feature allows 1 to 128 bytes of data to be written into the EEPROM in a single write cycle. Loading the first byte of data, the data load window opens 30µs for the second byte. In the same manner each additional byte of data can be loaded within 30µs of the preceding falling edge of either \overline{WE} or \overline{CE} . When \overline{CE} and \overline{WE} are kept high for 100µs after data input, the EEPROM enters the write mode automatically and the data input is written into the EEPROM.

\overline{WE} , \overline{CE} Pin Operation

During a write cycle, addresses are latched by the falling edge of \overline{WE} or \overline{CE} , and data is latched by the rising edge of \overline{WE} or \overline{CE} .

Data Polling

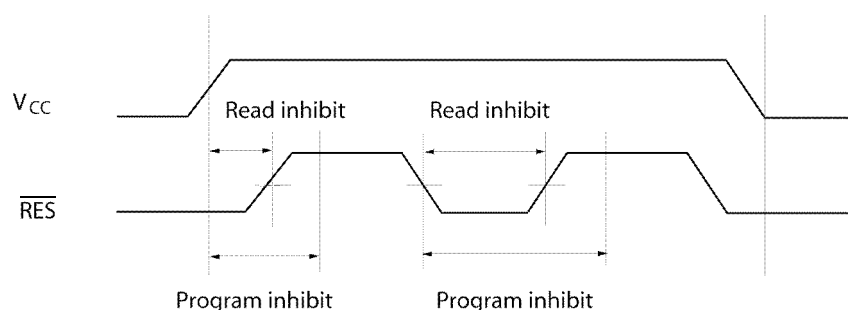

Data Polling function allows the status of the EEPROM to be determined. If EEPROM is set to read mode during a write cycle, an inversion of the last byte of data to be loaded outputs from I/O 7 to indicate that the EEPROM is performing a write operation.

RDY/Busy Signal

RDY/Busy signal also allows a comparison operation to determine the status of the EEPROM. The RDY/Busy signal goes low (V_{OL}) after the first write signal. At the end of the write cycle, the RDY/Busy returns to a high state (V_{OH}).

RES Signal

When \overline{RES} is LOW (V_L), the EEPROM cannot be read or programmed. The EEPROM data must be protected by keeping \overline{RES} low when V_{CC} is power on and off. \overline{RES} should be high (V_H) during read and programming operations.

Data Protection

To protect the data during operation and power on/off, the EEPROM has the internal functions described below.

1. Data Protection against Noise of Control Pins (\overline{CE} , \overline{OE} , \overline{WE}) during Operation.

During readout or standby, noise on the control pins may act as a trigger and turn the EEPROM to programming mode by mistake. To prevent this phenomenon, the EEPROM has a noise cancellation function that cuts noise if its width is 20ns or less in programming mode. Be careful not to allow noise of a width more than 20ns on the control pins.

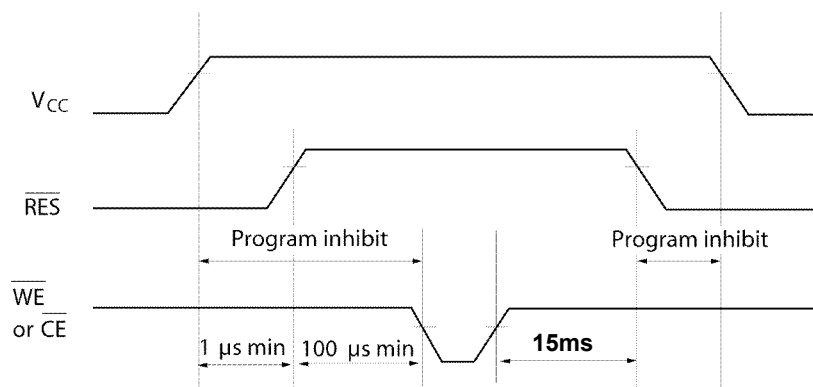

2. Data Protection at V_{CC} on/off

When V_{CC} is turned on or off, noise on the control pins generated by external circuits, such as CPUs, may turn the EEPROM to programming mode by mistake. To prevent this unintentional programming, the EEPROM must be kept in unprogrammable state during V_{CC} on/off by using a CPU reset signal to \overline{RES} pin.

3. \overline{RES} Signal

\overline{RES} should be kept at V_{SS} level when V_{CC} is turned on or off. The EEPROM breaks off programming operation when \overline{RES} become low, programming operation doesn't finish correctly in case that \overline{RES} falls low during programming operation. \overline{RES} should be kept high for 10 ms after the last data is input

4. Software Data Protection Enable

The 79LV2040 contains a software controlled write protection feature that allows the user to inhibit all write operations to the device. This is useful in protecting the device from unwanted write cycles due to uncontrollable circuit noise or inadvertent writes caused by minor bus contentions. Software data protection is enabled by writing the following data sequence to the EEPROM and allowing the write cycle period (t_{WC}) of 15ms to elapse:

Software Data Protection Enable Sequence

Address	Data
5555	AA AA AA AA AA
AAAA or 2AAA	55 55 55 55 55
5555	A0 A0 A0 A0 A0

5. Writing to the Memory with Software Data Protection Enabled

To write to the device once Software protection is enabled, the enable sequence must precede the data to be written. This sequence allows the write to occur while at the same time keeping the software protection enabled

Sequence for Writing Data with Software Protection Enabled.

Address	Data
5555	AA AA AA AA AA
AAAA or 2AAA	55 55 55 55 55
5555	A0 A0 A0 A0 A0
Write Address(s)	Normal Data Input

6. Disabling Software Protection

Software data protection mode can be disabled by inputting the following 6 bytes sequence. Once the software protection sequence has been written, no data can be written to the memory until the write cycle (T_{WC}) has elapsed.

Software Protection Disable Sequence

Address	Data
5555	AA AA AA AA AA
AAAA or 2AAA	55 55 55 55 55
5555	80 80 80 80 80
5555	AA AA AA AA AA
AAAA or 2AAA	55 55 55 55 55
5555	20 20 20 20 20

Devices are shipped in the “unprotected” state, meaning that the contents of the memory can be changed as required by the user. After the software data protection is enabled, the device enters the Protect Mode where no further write commands have any effect on the memory contents.
