

79LV0408

Low Voltage 4 Megabit (512k x 8-bit) EEPROM

FEATURES

-
-
- Four 128k x 8-bit EEPROMs MCM
- RAD-PAK® radiation-hardened against natural space radiation
- Total dose hardness:
 - > 100 krad (Si), depending upon space mission
- Excellent Single event effects @ 25°C
 - SEL > 120 MeV cm²/mg (Device)
 - SEU > 85 MeV cm²/mg (Memory Cells)
 - SEU > 18 MeV cm²/mg (Write Mode)
 - SET > 40 MeV cm²/mg (Read Mode)
- Package
 - 40 Pin RAD-PAK® Flat Pack
 - 40 Pin RAD-PAK® Rad Tolerant Flat Pack
- High speed:
 - 200 and 250 ns access times available
- Data Polling and Ready/Busy signal
- Software data protection
- Write protection by RES pin
- High endurance
 - 10,000 erase/write (Page Mode),
 - 10 year data retention
- Page write mode: 1 to 128 byte page
- Low power dissipation
 - 88 mW/MHz active mode
 - 440 μW standby mode

DESCRIPTION

Maxwell Technologies' 79LV0408 multi-chip module (MCM) memory features a greater than 100 krad (Si) total dose tolerance, depending upon space mission. Using Maxwell Technologies' patented radiation-hardened RAD-PAK® MCM packaging technology, the 79LV0408 is the first radiation-hardened 4 Megabit MCM EEPROM for space applications. The 79LV0408 uses four 1 Megabit high-speed CMOS die to yield a 4 Megabit product. The 79LV0408 is capable of in-system electrical Byte and Page programmability. It has a 128 bytes Page Programming function to make its erase and write operations faster. It also features Data Polling and a Ready/Busy signal to indicate the completion of erase and programming operations. In the 79LV0408, hardware data protection is provided with the RES pin, in addition to noise protection on the WE signal. Software data protection is implemented using the JEDEC optional standard algorithm.

Maxwell Technologies' patented RAD-PAK® packaging technology incorporates radiation shielding in the microcircuit package. It eliminates the need for box shielding while providing the required radiation shielding for a lifetime in orbit or space mission. In a GEO orbit, the RAD-PAK® package provides greater than 100 krad (Si) radiation dose tolerance. This product is available with screening up to Maxwell Technologies self-defined Class K.

TABLE 1. 79LV0408 PIN DESCRIPTION

PIN	SYMBOL	DESCRIPTION
16-9, 32-31, 28, 30, 8, 33, 7, 36, 6	A0 to A16	Address Input
17-19, 22-26	I/O0 to I/O7	Data Input/Output
29	\overline{OE}	Output Enable
2, 3, 39, 38	$\overline{CE1-4}$	Chip Enable 1 through 4
34	\overline{WE}	Write Enable
1, 27, 40	VCC	Power Supply
4, 20, 21, 37	VSS	Ground
5	RDY/BUSY	Ready/Busy
35	\overline{RES}	Reset

Write Start Time ³ -200 -250	t_{DW}	9, 10, 11	150 150	-- --	ns
RES to Write Setup Time -200 -250	t_{RP}	9, 10, 11	100 100	-- --	μs
V_{CC} to RES Setup Time ⁴ -200 -250	t_{RES}	9, 10, 11	1 1	-- --	μs

1. Use this device in a longer cycle than this value.
2. t_{WC} must be longer than this value unless polling techniques or RDY/BUSY are used. This device automatically completes the internal write operation within this value.
3. Next read or write operation can be initiated after t_{DW} if polling techniques or RDY/BUSY are used.
4. Guaranteed by design.

TABLE 9. 79LV0408 MODE SELECTION 1, 2

PARAMETER	\overline{CE}^3	\overline{OE}	\overline{WE}	I/O	\overline{RES}	RDY/BUSY
Read	V_{IL}	V_{IL}	V_{IH}	D_{OUT}	V_H	High-Z

EEPROM APPLICATION NOTES

This application note describes the programming procedures for each EEPROM module (four in each MCM) and details of various techniques to preserve data protection.

Automatic Page Write

Page-mode write feature allows from 1 to 128 bytes of data to be written into the EEPROM in a single write cycle, and allows the undefined data within 128 bytes to be written corresponding to the undefined address (A0 to A6). Loading the first byte of data, the data load window opens 30 μ s for the second byte. In the same manner each additional byte of data can be loaded within 30 μ s. In case CE and WE are kept high for 100 μ s after data input, the EEPROM enters erase and write mode automatically and only the input data are written into the EEPROM.

WE CE Pin Operation

During a write cycle, addresses are latched by the falling edge of WE or CE, and data is latched by the rising edge of WE or CE.

Data Polling

Data Polling function allows the status of the EEPROM to be determined. If the EEPROM is set to read mode during a write cycle, an inversion of the last byte of data to be loaded output is from I/O 7 to indicate that the EEPROM is performing a write operation.

RDY/Busy Signal

RDY/Busy signal also allows a comparison operation to determine the status of the EEPROM. The RDY/Busy signal has high impedance except in write cycle and is lowered to V_{OL} after the first write signal. At the-end of a write cycle, the RDY/Busy signal changes state to high impedance.

RES Signal

When RES is LOW, the EEPROM cannot be read and programmed. Therefore, data can be protected by keeping RES low when V_{CC} is switched. RES should be kept high during read and programming because it doesn't provide a latch function.

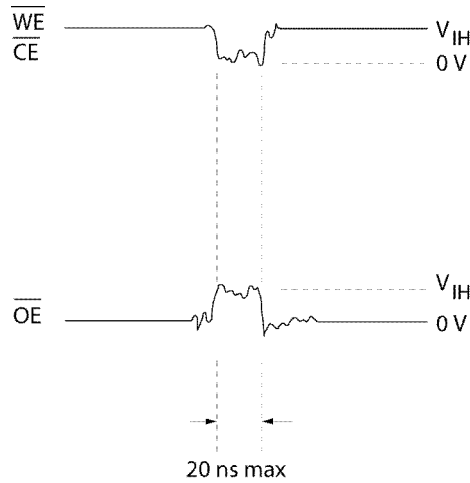

Data Protection

To protect the data during operation and power on/off, the EEPROM has the internal functions described below.

1. Data Protection against Noise of Control Pins (CE, OE, WE) during Operation.

During readout or standby, noise on the control pins may act as a trigger and turn the EEPROM to programming mode by mistake. To prevent this phenomenon, the EEPROM has a noise cancellation func-

tion that cuts noise if its width is 20 ns or less in programming mode. Be careful not to allow noise of a width of more than 20ns on the control pins.

2. Data Protection at V_{CC} on/off

When V_{CC} is turned on or off, noise on the control pins generated by external circuits, such as CPUs, may turn the EEPROM to programming mode by mistake. To prevent this unintentional programming, the EEPROM must be kept in unprogrammable state during V_{CC} on/off by using a CPU reset signal to \overline{RES} pin.

\overline{RES} should be kept at V_{SS} level when V_{CC} is turned on or off. The EEPROM breaks off programming operation when \overline{RES} becomes low, programming operation doesn't finish correctly in case that \overline{RES} falls low during programming operation. \overline{RES} should be kept high for 10 ms after the last data input.

3. Software Data Protection

The software data protection function is to prevent unintentional programming caused by noise generated by external circuits. In software data protection mode, 3 bytes of data must be input before write data as follows. These bytes can switch the non-protection mode to the protection mode.

Software data protection mode can be canceled by inputting the following 6 bytes. Then, the EEPROM turns to the non-protection mode and can write data normally. However, when the data is input in the canceling cycle, the data cannot be written.

Important Notice:

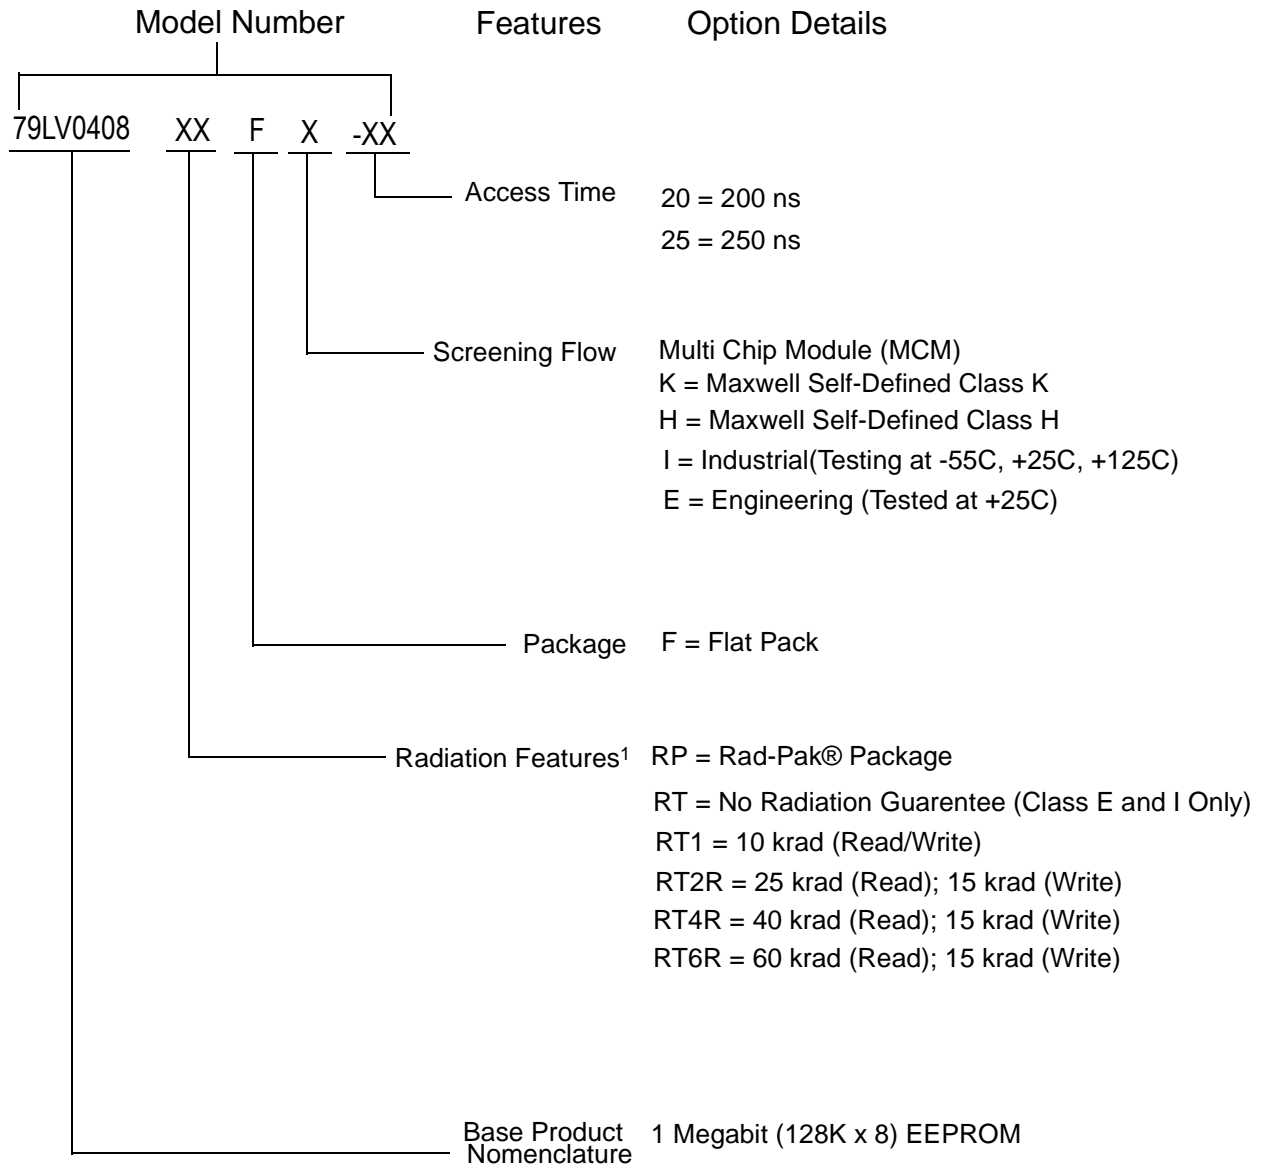

These data sheets are created using the chip manufacturers published specifications. Maxwell Technologies verifies functionality by testing key parameters either by 100% testing, sample testing or characterization.

The specifications presented within these data sheets represent the latest and most accurate information available to date. However, these specifications are subject to change without notice and Maxwell Technologies assumes no responsibility for the use of this information.

Maxwell Technologies' products are not authorized for use as critical components in life support devices or systems without express written approval from Maxwell Technologies.

Any claim against Maxwell Technologies must be made within 90 days from the date of shipment from Maxwell Technologies. Maxwell Technologies' liability shall be limited to replacement of defective parts.

Product Ordering Options

1) The device will meet the specified read mode TID level, at the die level, if it not written to during irradiation. Writing to the device during irradiation will reduce the device's TID tolerance to the specified write mode TID level. Writing to the device before irradiation does not alter the device's read mode TID level.
