Maxwell Technologies’ 3V 5F ultracapacitor cell is part of Maxwell’s latest full-featured 3.0V product platform designed to provide energy storage in support of the latest trends in renewable energy, smart grid, and IoT. Designed from the ground up, Maxwell developed the 3V small cell products to be high energy, high power solutions that also incorporate the XP™ technology offering enhanced performance under adverse environmental conditions. Whether used alone, integrated into a module assembly, or in a hybrid configuration, Maxwell’s 3V products will help reduce the overall cost and size of the system while improving return on investments for the customer.

Ultracapacitors are the technology of choice for high energy and high power applications because of their longer operating lifetime, low maintenance requirements, and superior cold weather performance when compared to batteries.

**FEATURES AND BENEFITS**

- Enhanced performance under adverse environmental conditions
- Updated Bill of Materials compared to earlier 2.7V XP products resulting in improved performance at higher voltage
- Long lifetimes with up to 1,000,000 duty cycles*
- Compliant with UL, RoHS and REACH requirements

**TYPICAL APPLICATIONS**

- Actuators
- Emergency Lighting
- Telematics / IoT
- Automotive
- Security Equipment
- Backup and UPS Systems
- Advanced Metering

NOTES

1. Surge Voltage
   Absolute maximum voltage, non-repetitive. The duration must not exceed 1 second.

2. Rated Capacitance & ESR<sub>BOL</sub> (Measurement Method)
   - Capacitance: Constant current charge (10mA/F) to V<sub>R</sub> 5 min hold at V<sub>R</sub> constant current discharge (10mA/F) to 0.1V.
   - ESR<sub>BOL</sub>: Constant current charge (10mA/F) to V<sub>R</sub> 5 min hold at V<sub>R</sub> constant current discharge (40 x C<sub>B</sub> x V<sub>R</sub> [mA]) to 0.1V.

3. Leakage Current (Measurement Method)
   - Current measured after 72 hours of constant voltage hold at V<sub>R</sub> and 25°C.
   - Initial leakage current can be higher.

4. Peak Current
   - Current needed to discharge cell or module from V<sub>R</sub> to 1/2V<sub>R</sub> in 1 second.
   \[ i_{\text{peak}} = \frac{\Delta V}{\Delta t / C_i} - R_i \]
   where \( i_{\text{peak}} \) is the maximum peak current (A);
   \( V_R \) is the rated voltage (V);
   \( \Delta t \) is the discharge time (sec); \( \Delta t = 1 \text{ sec in this case} \);
   \( C_i \) is the rated BOL capacitance (F);
   \( R_i \) is the typical BOL ESR (Ω).
   - The stated peak current should not be used in normal operation and is provided as a reference value only.

5. Energy & Power (Based on IEC 62576)
   - Usable Specific Power, \( P_u \) (W/kg) = \( \frac{0.12V_R^2}{R_i x m} \)
   - Impedance Match Specific Power, \( P_{\text{MAX}} \) (W/kg) = \( \frac{0.25V_R^2}{R_i x m} \)
   - Gravimetric Specific Energy, \( E_u \) (Wh/kg) = \( \frac{E_{\text{MAX}}}{m} \)
   - Stored Energy, \( E_{\text{MAX}} \) (Wh) = \( \frac{1}{2} C_i V_R^2 \)
   where \( V_R \) is the rated voltage (V);
   \( R_i \) is the typical BOL ESR (Ω);
   \( m \) is the typical mass (kg);
   \( C_i \) is the rated BOL capacitance (F).

6. Projected Cycle Life
   - Constant current charge-discharge cycle from V<sub>R</sub> to 1/2V<sub>R</sub> at 25°C.
   - Cycle life is dependent upon application-specific characteristics. Actual results will vary.

7. Continuous Current & Thermal Resistance
   - Maximum current which can be used continuously within the allowed temperature range.
   \[ I_{\text{MAX}} = \sqrt{\frac{\Delta T}{R_i + R_2}} \]
   where \( I_{\text{MAX}} \) is the maximum continuous current (A);
   \( \Delta T \) is the change in temperature (°C);
   \( R_i \) is the typical thermal resistance (°C/W);
   \( R_2 \) is the maximum BOL ESR (Ω).

8. BOL & EOL Conditions
   - BOL (Beginning of Life): Rated/Initial product performance
     - Capacitance: 80% of min. BOL rating (0.8 x min. \( C_i \))
     - ESR<sub>BOL</sub>: 200% of max. BOL rating (2 x max. \( R_i \))

9. Transportation Regulation
   - Per United Nations material classification UN3499, all Maxwell ultracapacitor cells have less than 10Wh stored energy to meet the requirements of Special Provisions 361. Both individual ultracapacitors and modules composed of ultracapacitors shipped by Maxwell can be transported without being treated as dangerous goods (hazardous materials) under transportation regulations.

DETAILED PRODUCT DESCRIPTION

Introduction
The BCAP0005 P300 X11 energy storage cell is a robust ultracapacitor solution in a leaded cylindrical style can. The 3.0V 5F cell design uses Maxwell’s proprietary XP™ high heat and humidity environmental technology to provide maximum life under adverse conditions.

Technology Overview
Ultracapacitor, also known as supercapacitor or electric double layer capacitor (EDLC), delivers energy at relatively high rates (beyond those accessible with batteries). Ultracapacitors store charge electrostatically (non-Faradaic) by reversible adsorption of the electrolyte onto electrochemically stable high surface area carbon electrodes. Charge separation occurs on polarization at the electrode/electrolyte interface, producing a double layer. This mechanism is highly reversible, allowing the ultracapacitor to be charged and discharged hundreds of thousands of times.*

Ultracapacitor Construction
An ultracapacitor is constructed with symmetric carbon positive and negative electrodes separated by an insulating ion-permeable separator and packaged into a container filled with organic electrolyte (salt/solvent) designed to maximize ionic conductivity and electrode wetting. It is the combination of high surface-area activated carbon electrodes (typically >1500m<sup>2</sup>/g) with extremely small charge separation (Angstroms) that results in high capacitance.

*Results may vary. Additional terms and conditions, including the limited warranty, apply at the time of purchase. See the warranty details for applicable operating and use requirements.
